## 1.2. Integración por Simpson

## 2.7. Algoritmo de Bellman-Ford

Si no hay ciclos de coste negativo, encuentra la distancia más corta entre un nodo y todos los demás. Si sí hay, permite saberlo.

El coste de las aristas sí puede ser negativo.

int n; //Cantidad de nodos
int m; //Cantidad de aristas

/*
Retorna falso si hay un ciclo de costo negativo.

Si retorna verdadero, entonces d[i] contiene la distancia más corta entre el s y el
nodo i.
*/

    e = new edge[n];
    //...

    for (int i=0; i<n; ++i) d[i] = INT_MAX;

    for (int i=0; i<n-1; ++i){

## 2.9. Máximo flujo: Método de Ford-Fulkerson, algoritmo de Edmonds-Karp

El algoritmo de Edmonds-Karp es una modificación al método de Ford-Fulkerson. Este último utiliza DFS para hallar un camino de aumentación, pero la sugerencia de Edmonds-Karp es utilizar BFS que lo hace más eficiente en algunos grafos.

```

/*
cap[i][j] = Capacidad de la arista (i, j).
flow[i][j] = Flujo actual de i a j.
prev[i] = Predecesor del nodo i en un camino de aumentación.
*/

int fordFulkerson(int n, int s, int t){
    int ans = 0;
    for (int i=0; i<n; ++i) fill(flow[i], flow[i]+n, 0);
    while (true){
        fill(prev, prev+n, -1);
        queue<int> q;
        q.push(s);
        while (q.size() && prev[t] == -1){
            int u = q.front();
            q.pop();
            for (int v = 0; v<n; ++v)
                if (v != s && prev[v] == -1 && cap[u][v] > flow[u][v])
                    prev[v] = u, q.push(v);
        }

        if (prev[t] == -1) break;

        int bottleneck = INT_MAX;
        for (int v = t, u = prev[v]; u != -1; v = u, u = prev[v]){
            bottleneck = min(bottleneck, cap[u][v] - flow[u][v]);

        for (int v = t, u = prev[v]; u != -1; v = u, u = prev[v]){
            flow[u][v] += bottleneck;
            flow[v][u] = -flow[u][v];

### 4.1. Área de un polígono

Si  $P$  es un polígono simple (no se intersecta a sí mismo) su área está dada por:

$$A(P) = \frac{1}{2} \sum_{i=0}^{n-1} (x_i \cdot y_{i+1} - x_{i+1} \cdot y_i)$$

```

//P es un polígono ordenado anticlockwise.
//Si es clockwise, retorna el area negativa.
//Si no esta ordenado retorna pura mierda.
//P[0] != P[n-1]
double PolygonArea(const vector<point> &p){
    double r = 0.0;
    for (int i=0; i<p.size(); ++i){
        int j = (i+1) % p.size();
        r += p[i].x*p[j].y - p[j].x*p[i].y;
    }
    return r/2.0;
}

```

### 4.2. Centro de masa de un polígono

Si  $P$  es un polígono simple (no se intersecta a sí mismo) su centro de masa está dado por:

$$\bar{C}_x = \frac{\iint_R x \, dA}{M} = \frac{1}{6M} \sum_{i=1}^n (y_{i+1} - y_i)(x_{i+1}^2 + x_{i+1} \cdot x_i + x_i^2)$$

$$\bar{C}_y = \frac{\iint_R y \, dA}{M} = \frac{1}{6M} \sum_{i=1}^n (x_i - x_{i+1})(y_{i+1}^2 + y_{i+1} \cdot y_i + y_i^2)$$

Donde  $M$  es el área del polígono.

Otra posible fórmula equivalente:

$$\bar{C}_x = \frac{1}{6A} \sum_{i=0}^{n-1} (x_i + x_{i+1})(x_i \cdot y_{i+1} - x_{i+1} \cdot y_i)$$

$$\bar{C}_y = \frac{1}{6A} \sum_{i=0}^{n-1} (y_i + y_{i+1})(x_i \cdot y_{i+1} - x_{i+1} \cdot y_i)$$

### Partial Fractions

Let  $N(x)$  and  $D(x)$  be polynomial functions of  $x$ . We can break down  $N(x)/D(x)$  using partial fraction expansion. First, if the degree of  $N$  is greater than or equal to the degree of  $D$ , divide  $N$  by  $D$ , obtaining

$$\frac{N(x)}{D(x)} = Q(x) + \frac{N'(x)}{D(x)},$$

where the degree of  $N'$  is less than that of  $D$ . Second, factor  $D(x)$ . Use the following rules: For a non-repeated factor:

$$\frac{N(x)}{(x-a)D(x)} = \frac{A}{x-a} + \frac{N'(x)}{D(x)},$$

where

$$A = \left[ \frac{N(x)}{D(x)} \right]_{x=a}.$$

For a repeated factor:

$$\frac{N(x)}{(x-a)^m D(x)} = \sum_{k=0}^{m-1} \frac{A_k}{(x-a)^{m-k}} + \frac{N'(x)}{D(x)},$$

where

$$A_k = \frac{1}{k!} \left[ \frac{d^k}{dx^k} \left( \frac{N(x)}{D(x)} \right) \right]_{x=a}.$$

The reasonable man adapts himself to the world; the unreasonable persists in trying to adapt the world to himself. Therefore all progress depends on the unreasonable.

Ordinary power series:

$$A(x) = \sum_{i=0}^{\infty} a_i x^i.$$

Exponential power series:

$$A(x) = \sum_{i=0}^{\infty} a_i \frac{x^i}{i!}.$$

Dirichlet power series:

$$A(x) = \sum_{i=1}^{\infty} \frac{a_i}{i^x}.$$

Binomial theorem:

$$(x+y)^n = \sum_{k=0}^n \binom{n}{k} x^{n-k} y^k.$$

Difference of like powers:

$$x^n - y^n = (x-y) \sum_{k=0}^{n-1} x^{n-1-k} y^k.$$

For ordinary power series:

$$\alpha A(x) + \beta B(x) = \sum_{i=0}^{\infty} (\alpha a_i + \beta b_i) x^i,$$

$$x^k A(x) = \sum_{i=k}^{\infty} a_{i-k} x^i,$$

$$\frac{A(x) - \sum_{i=0}^{k-1} a_i x^i}{x^k} = \sum_{i=0}^{\infty} a_{i+k} x^i,$$

$$A(cx) = \sum_{i=0}^{\infty} c^i a_i x^i,$$

$$A'(x) = \sum_{i=0}^{\infty} (i+1) a_{i+1} x^i,$$

$$xA'(x) = \sum_{i=1}^{\infty} ia_i x^i,$$

$$\int A(x) dx = \sum_{i=1}^{\infty} \frac{a_{i-1}}{i} x^i,$$

$$\frac{A(x) + A(-x)}{2} = \sum_{i=0}^{\infty} a_{2i} x^{2i},$$

$$\frac{A(x) - A(-x)}{2} = \sum_{i=0}^{\infty} a_{2i+1} x^{2i+1}.$$

Summation: If  $b_i = \sum_{j=0}^i a_j$  then

$$B(x) = \frac{1}{1-x} A(x).$$

Convolution:

$$A(x)B(x) = \sum_{i=0}^{\infty} \left( \sum_{j=0}^i a_j b_{i-j} \right) x^i.$$
